Title:

Remediation of Missing Element 'Key-shaped Crab' by D A Marine Mineral

1. Overview:

The patient, a 7-year-old child, was found to have uneven and bumpy nails in June 2022. No treatment was given at the time. In July, the condition worsened with more severe nail bed depressions, and the nails became rough and thick. The family doctor conducted an examination and found that all indicators were normal. The doctor suggested continued observation or referral to a specialist. However, after being referred to a specialist, no specific measures were given, and the patient remained on the waiting list at the BC Children's Hospital until the time of writing this report.

In late August 2022, the patient began taking oral D A Marine Mineral Drops and applying external D A Marine Mineral Body Spray. The condition was cured in November.

By the end of February 2023, new nails had grown out fully and appeared plump, pink, and healthy.

6. The comparison results after using the D A Marine Mineral:

大安海矿修复“匙状甲”前后对比

Patient's self-report: After using D A Marine Mineral for three months, the nails have significantly improved and are no longer sunken; after six months, all old nail tissues have detached and new nails have completely grown back to normal.

7. Summary:

A central depression in the entire nail with raised edges, known as spoon-shaped nails or koilonychia, is a common nail abnormality. It is characterized by thinning of the nail, central depression, and raised edges, forming a spoon shape. This condition is often associated with internal diseases such as iron-deficiency anemia, thyroid diseases, and other changes in the nails.

D A Marine Mineral has shown significant effectiveness in repairing nail abnormalities caused by nutrient deficiencies due to its mineral element structure ratio and types that are similar to those found in human blood.
